

During the review session with Team HP and Team TeacherImpact, we received and gave great advice and had a productive hour of critiquing each other's projects so far. Everyone was professional and critical in spotting any discrepancies they found with any aspect of the three projects showcased during the meeting. Here are notes that were taken during the design critique:

- Reduce submit button (make it smaller for devices and also makes the form easier to read)
- Create maintenance group
 - Have an account especially for maintenance which eliminates the need for database connection
- Click to view notes (no notes have different text)
 - If no notes are in the complaint, then show off the text to display differently on the walkthrough page indicating that there is no notes
- Search by date
 - To be able to keep track of walkthrough number
- Filter by status (to eliminate fixed from not fixed)
 - Since tables will become huge, it would be nice to be able to get rid of values that aren't necessary and show the users what is important
- Change partially fixed to in progress
 - Minor wording change
- Change maintenance view to have extra field to solidify a solution to a problem
 - Goes with maintenance accounts, helps remove the ability for someone to make a mistake
- Tag update with specific users
 - Keep track of all entries just as a logging system and as a means of getting more info on a certain problem experienced

For these ideas, our team plans on having most if not all of these implemented before we talk with our clients again. Some of these range from minor UI changes and others require more back end support for functionality. We are going to delegate out each of these as tasks to the members of our group and set a deadline for these to be completed. These ideas give the application a more professional feel and brings extra functionality to the site altogether. Since the end of the semester is quickly approaching, the deadline for these to be completed is close.
